Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

frivol::Array< T >	
Simple fixed-size array of elements of type T	3
frivol::DummyPriorityQueue< PriorityT >	
Simple implementation of PriorityQueueConcept	4
frivol::DummySearchTree< ElementT >	
Simple implementation of SearchTreeConcept (a wrapper around std::list)	5
frivol::Policy< CoordT, EventQueueT, BeachLineT >	5
frivol::PriorityQueueConcept< X, PriorityT >	5
frivol::SearchTreeConcept< X, ElementT >	6

Chapter 2

Class Documentation

2.1 `frivol::Array< T >` Class Template Reference

Simple fixed-size array of elements of type T.

```
#include <array.hpp>
```

Public Member Functions

- `Array` (Idx size)
- Idx `getSize` () const
Returns the size of the array.
- void `resize` (Idx size)

- const T & `operator[]` (Idx index) const
- T & `operator[]` (Idx index)

2.1.1 Constructor & Destructor Documentation

2.1.1.1 `template<typename T > frivol::Array< T >::Array (Idx size)`

Creates an array with all elements default-constructed.

Parameters

<i>size</i>	The size of the array.
-------------	------------------------

2.1.2 Member Function Documentation

2.1.2.1 `template<typename T > const T & frivol::Array< T >::operator[] (Idx index) const`

Returns reference to an element in the array.

Parameters

<i>index</i>	The zero-based index of the element.
--------------	--------------------------------------

Exceptions

<i>std::out_of_range</i>	if FRIVOL_ARRAY_BOUNDS_CHECKING is defined and 'index' overflows.
--------------------------	-------------------------------------------------------------------

2.1.2.2 `template<typename T> T & frivol::Array< T >::operator[] (Idx index)`

Returns reference to an element in the array.

Parameters

<i>index</i>	The zero-based index of the element.
--------------	--------------------------------------

Exceptions

<i>std::out_of_range</i>	if FRIVOL_ARRAY_BOUNDS_CHECKING is defined and 'index' overflows.
--------------------------	-------------------------------------------------------------------

2.1.2.3 `template<typename T> void frivol::Array< T >::resize (Idx size)`

Resizes the array to size. If size decreases the extra elements are removed. If size increases, the new elements are default-constructed. The operation may assign the current elements to a new place, and therefore pointers to the array may be invalidated.

Parameters

<i>size</i>	The new size.
-------------	---------------

The documentation for this class was generated from the following files:

- /home/topi/unison/Asiakirjat/frivol/frivol/array.hpp
- /home/topi/unison/Asiakirjat/frivol/frivol/array_impl.hpp

2.2 `frivol::DummyPriorityQueue< PriorityT >` Class Template Reference

Simple implementation of [PriorityQueueConcept](#).

```
#include <priority_queue_concept.hpp>
```

Public Member Functions

- **DummyPriorityQueue** (Idx size)
- Idx **pop** ()
- bool **empty** () const
- void **setPriority** (Idx key, PriorityT priority)
- void **setPriorityNIL** (Idx key)

The documentation for this class was generated from the following files:

- /home/topi/unison/Asiakirjat/frivol/frivol/priority_queue_concept.hpp
- /home/topi/unison/Asiakirjat/frivol/frivol/priority_queue_concept_impl.hpp

2.3 frivol::DummySearchTree< ElementT > Class Template Reference

Simple implementation of [SearchTreeConcept](#) (a wrapper around std::list).

```
#include <search_tree_concept.hpp>
```

Public Types

- typedef std::list< ElementT >::iterator **Iterator**

Public Member Functions

- template<typename FuncT > Iterator **search** (FuncT func)

The documentation for this class was generated from the following file:

- /home/topi/unison/Asiakirjat/frivol/frivol/search_tree_concept.hpp

2.4 frivol::Policy< CoordT, EventQueueT, BeachLineT > Struct Template Reference

```
#include <policy.hpp>
```

Public Types

- typedef CoordT **Coord**

2.4.1 Detailed Description

```
template<typename CoordT, template< typename PriorityT > class EventQueueT, template< typename ElementT > class BeachLineT> struct frivol::Policy< CoordT, EventQueueT, BeachLineT >
```

[Policy](#) class for the Fortune's algorithm, specifying data types and data structures to use.

Template Parameters

<i>CoordT</i>	The coordinate type to use. Should be a floating point type or similar type that does not over- or underflow easily.
<i>EventQueueT</i>	The priority queue type for events. Must conform to PriorityQueueConcept .
<i>BeachLineT</i>	The search tree to use for the "beach line" of arcs. Must conform to SearchTreeConcept .

The documentation for this struct was generated from the following file:

- /home/topi/unison/Asiakirjat/frivol/frivol/policy.hpp

2.5 frivol::PriorityQueueConcept< X, PriorityT > Class Template Reference

```
#include <priority_queue_concept.hpp>
```

2.5.1 Detailed Description

```
template<typename X, typename PriorityT> class frivol::PriorityQueueConcept< X, PriorityT >
```

Concept checking class for priority queues X with priority values of type PriorityT (or NIL). Priority queues are initialized with given size, and contain priority values for keys 0, 1, ..., size-1. Initially, all priority values are NIL. X must support the following operations:

- `<construct>(Idx size)` creates priority queue for keys 0, 1, ..., size-1.
- `bool empty()` const returns true if all keys have NIL priority.
- `Idx pop()` returns the key with lowest non-NIL priority and sets the priority of that key to NIL.
- `void setPriority(Idx key, PriorityT priority)` sets the priority value of 'key' to non-NIL value 'priority'.
- `void setPriorityNIL(Idx key)` sets the priority value of key 'key' to NIL.

X may assume that PriorityT is ordered with `<`-operator. X may have undefined behavior if supplied keys are out of range or if `pop()` is called when `empty()` returns true.

The documentation for this class was generated from the following file:

- `/home/topi/unison/Asiakirjat/frivol/frivol/priority_queue_concept.hpp`

2.6 frivol::SearchTreeConcept< X, ElementT > Class Template Reference

```
#include <search_tree_concept.hpp>
```

Public Types

- `typedef X::Iterator` **IteratorT**

2.6.1 Detailed Description

```
template<typename X, typename ElementT> class frivol::SearchTreeConcept< X, ElementT >
```

Concept checking class for search trees X for elements of type ElementT. Search trees are sequence containers, the elements of which are iterated using iterator objects of type X::Iterator. The iterator must be a standard bidirectional iterator. X must support the following operations:

- `<construct>()` creates empty search tree.
- `bool empty()` const returns true if the search tree is empty.
- `Iterator begin()` returns the iterator of the first element (or past-the-end if empty).
- `Iterator end()` returns the iterator past the last element.
- `template<typename FuncT> Iterator search(FuncT func)` searches the sequence using the supplied `int(-iterator)-function` that for given iterator `iter` returns negative if the searched element is before `iter`, positive if it is after `iter`, and 0 if `iter` is the right element. If an element such that `func` returns 0 is found, it is returned, otherwise `end()` is returned.
- `void erase(Iterator iter)` removes element at `iter`. Other iterators should not be invalidated.
- `void insert(Iterator iter, const ElementT& elem)` inserts `elem` before `iter`. Does not invalidate any iterators.

X may assume that ElementT is copy constructible.

The documentation for this class was generated from the following file:

- /home/topi/unison/Asiakirjat/frivol/frivol/search_tree_concept.hpp
